### **REASON FOR ALLOWANCE**

1. Johansson, Matsumeto et al, and Karpik disclose various types of a track driven device having a plurality of belts, wherein each of the plurality of belts encompasses a drive wheel and an idle wheel, said drive wheel rotating the belt and idle wheel via the belt, the track driven device comprising a plurality of suspension systems for absorbing load stresses, each of the plurality of suspension systems having a lower suspension bracket, said lower suspension bracket having first end operatively attached to a piston rod of a suspension cylinder and a distal end operatively and pivotably mounted a track frame pivot on a main frame of the track driven device, a track tension cylinder mounted between the axle of the idle wheel and a point of the frame. Purcell et al discloses a track driven device having a plurality of belts, wherein each of the plurality of belts encompasses a drive wheel and an idle wheel, said drive wheel rotating the belt and idle wheel via the belt, the track driven device comprising a plurality of suspension systems for absorbing load stresses, each of the plurality of suspension systems having a lower suspension bracket, a track tension cylinder mounted between the axle of the idle wheel and a point of the frame, a braking device including brake caliper. However, none of the references of record suggests a track driven device having a plurality of belts, wherein the idler wheel is rotatably mounted between a first side and a second side of the lower suspension bracket in the manner defined in the instant claims 1, and 15 and in combination with other limitations of the claims. Therefore, claims 2-14, 16-20, depending therefrom, are considered to be allowable.
